DETAILED ACTION

Drawings

1. Figure 8 should be designated by a legend such as --Prior Art-- because only that which is old is illustrated. See MPEP § 608.02(g). Corrected drawings in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. The replacement sheet(s) should be labeled "Replacement Sheet" in the page header (as per 37 CFR 1.84(c)) so as not to obstruct any portion of the drawing figures. If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Rejections - 35 USC § 102

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1 through 6 are rejected under 35 U.S.C. 102(b) as being anticipated by Endo, 6240350.

3. Endo discloses a self-aligning torque estimating section which estimates a self-aligning torque by and a steering torque feedback section which performs definition of a steering reaction force based on a self-aligning torque estimated value which has been estimated by the self-aligning torque estimating section and feeds the steering reaction force back to the steering torque; said self-aligning torque estimating section estimates

the self-aligning torque by a disturbance observer constitution; the self-aligning torque estimating section is allowed to estimate the self-aligning torque from a motor rotation signal or angular speed signal and a motor electric current command value; and definition of static characteristics of the steering torque feedback section is determined based on the steering reaction force and the self-aligning torque estimated value; the definition of dynamic characteristics of the steering reaction force of the steering torque feedback section is performed such that a gain of a transfer function in a frequency band of information which is desirous to be conveyed to a driver is allowed to be large, while the gain of the transfer function in the frequency band of information which is not desirous to be conveyed to the driver is allowed to be small; and a characteristic of a controller into which a deviation between the steering torque and an output from the steering torque feedback section is inputted is allowed to be a proportional factor in a low range and a cutoff factor in a high range, without containing an integral factor on columns 1, 2, 6, 7, and 8.

4. Applicant doesn't seem to have claimed the invention as it is disclosed in the specification. For instance, some of the terms in the claims aren't specifically defined in the specification and this leaves them open to interpretation. One example would be "a disturbance observer constitution."
